Introduction. In medicine diagnosis is the process of establishing the diagnosis by identifying the nature and cause of a particular disease, symptom or condition of the patient. The necessity of diagnosis establishment comes not so much from a desire to know the absolute truth, but rather to act in the patient's benefit. In pediatrics, the diagnosis is a process especially complex. Dilemma of uncertainty in pediatric diagnostic occurs because of insufficient clinical data, the inability or limited ability of children to communicate. Since decisions in pediatrics are processes that involve analysis and synthesis of all the data, the relationship doctor-parent has an important role. Also in the process of establishing the diagnosis, clinicians may face a number of moral dilemmas. Philosophy of contemporary medicine supports the hypothesis that the efficiency of medical care can be ensured by guiding principles of bioethics.
