Nr. 4 (61), 2016

Long-term results were followed up in 46 patients: good (18), satisfactory (23). Unsatisfactory outcomes were in 5 cases because of absence of the ankylosis and presence of the pain.

### **Conclusion:**

Selective wrist arthrodesis is indicated in deforming arthritis grade II or III of diverse etiology

**Keywords:** pseudoarthrosis of the scaphoid, Kienbock disease, selective arthrodesis

## RESULTS OF THALAMIC CALCANEAL FRACTURE TREATMENT

Orthopedics and Traumatology Clinic "Vitalie Beţişor", State University of Medicine and Pharmacy "Nicolae Testemiţanu", Republic of Moldova

The aim: Analyzing the results of thalamic calcaneus fracture treatment in dependence of type and treatment method. Materials and methods: There were analyzed 198 clinical cases of calcaneal fractures treated in the clinic "V. Beţişor" during the years 2014-2016. Patients were divided into 2 groups - I (65 patients - 33%) treated surgically (open reduction and plate and / or screws osteosynthesis, capsulo-ligamentotaxisin the Ilizarov apparatus), II (133 patients-67%) treated conservatively. Men accounted for 81% (160) and women 19% (38). The average age was 45 years, with limits between 20 and 78 years. According to the values Böhler angle fractures were of grade II (101 cases) - 51%, grade I (60) - 30% and grade III (37) - 19%. Average length of stay was 13 days for patients treated surgically, and 7 days in patients treated conservatively. Results: Of the 198 patients were reexamined clinical and radiological and evaluated according to AOFAS Ankle-Hindfoot score Scale at 1-2 years from trauma 22 patients, of which 7 were performed surgical treatment, and 15 were treated conservatively. The results after surgical treatment (7): excellent (90 -100 p) -1 patient, good (72-89 p) - 4 patients, acceptable (41 - 71p) - 2 patients, bad (1-40 p) - 0, after orthopedic treatment (15): excellent -1 patient, good -6 patients, 6 patients acceptable, bad - 2 patients.

### **Conclusions:**

- 1. For the specifying the optimal treatment strategy is necessary a classification that could clearly definite the type of fracture.
- 2. Intra-articular fractures (thalamic) frequently require surgical tactics of treatment, reducing the articular surfaces ideal and stable fixation of the fragments.
- 3. The dominant principle in the treatment of these fractures is to restore the altered biomechanics of the foot.

# INTRA FOCAL OSTEOSYNTHESIS FOR DISTAL RADIAL FRACTURES IN EMERGENCY – KAPANDJI METHOD

Liviu Volentir\*, Sergiu Şoric\*, Alexandr Stanev\*, Alexandr Chimerciuc\*\*, Iurie Codreanu\*, Nicolae Petrachi\*

- \* Institute of Emergency Medicine, Chișinău, Republic of Moldova
- \*\*Municipal Hospital of Bălți, Republic of Moldova

**Aim:** to present the results of surgical treatment using Kapandji method in emergency.

**Material and methods:** were analyzed the results of surgical treatment in patients with distal radius fractures treated in IEM during 2013-2015. Fractures were classified using Kapandji A. (1988) classification. Emergency surgical treatment was applied in 106 (50.23%) cases, of which 85 (80.18%) was performed Kapandji method. Follow-up results were assessed according W. Gartland and Werley L. score (2000). The study group consisted of 85 patients, of whom women - 52 (61.17%), men - 33 (38.83%). The mean age was 41 years.

**Results:** according A. Kapandji classification in the study group were: type I - 2 cases, type II - 33 cases, type III - 3 cases, type IV - 13 cases, type V - 2 cases, type VI - 1 casetype VII - 1 case, type VIII - 9 cases, type IX - 15 cases, type X - 6 cases. K-wire ablation was performed at 35 days - 15 (17.6%) cases for I, II, IV types, at 40 days - 52 (61.2%) cases for II, V, VI types, at 45 days - 14 (16.5%) cases for III, VII, VIII, IX types and at 50 days - 4 (4 7%) cases for IX, X types. Follow-up results, according W. Gartland and L. Werley score, are positive in 84 (98.8%) cases of 85 patients. Excellent results (0-2 points) were 13 (15.3%) cases, good (3-8 points) - 41 (47.1%) cases, satisfactory (9-20 points) - 31 (36.5%) cases.

#### **Conclusions:**

Intrafocal osteosynthesis with K-wire – Kapandji method constitutes a minimally invasive procedure favorable for treatment of distal radius fractures.

The method is characterized by minimal intraoperative bleeding, low risk of postoperative complications and a good function and recovery.
