

356. NANOCARRIERS IN COSMETIC TECHNOLOGY

Author: **Mihaela Cotorobai**

Scientific adviser: Anton Mihail, MD, University assistant, Department of Drugs Technology
Nicolae Testemitanu State University of Medicine and Pharmacy of the Republic of Moldova

Introduction. It is always known that a beautiful skin is a cared skin. For this reason, the cosmetic products used for effective skin care have enjoyed a constant popularity. Nanotechnologies are often used for the development of new-generation cosmetics. A nanocarrier commonly found in modern cosmetics technology is liposome. It gives to the product some additional benefits that are not found in common products. Hyaluronic acid is a leader substance in plastic surgery and anti-aging products. It has many advantages for the skin, including the guarantee the strength, elasticity and tonus of the skin; protection and hydration of skin tissues etc. We suppose that a product that contains liposomal hyaluronic acid would be more effective than a traditional product.

Aim of the study. The study of applicability of liposomes in the formulation of cosmetics. Internal market research and study of population accessibility to cosmetic products containing liposomes. Elaboration of a cream containing liposomal hyaluronic acid.

Materials and methods. The market study of cosmetic products containing liposomes was carried out. It was elaborated the formula of the cream containing liposomal hyaluronic acid.

Results. The literature demonstrates several advantages of cosmetic products containing liposomes: a high degree of penetration, a more uniform distribution of the biologically active principles in the skin tissues and a high capacity retention of the active principle in biological tissue. Market research has elucidated a low presence of cosmetic products containing liposomes on market in the Republic of Moldova. This trend is found both in case of imported products (under 1%) as well as for those native (zero %). For the formulation of the cream containing liposomal hyaluronic acid has been taken into consideration role and nature of excipients as well as the method of incorporation of the active substance in nano-systems.

Conclusions. It is possible to develop a cream containing liposomal hyaluronic acid and placing it in market of the Republic of Moldova, such a product will be a welcomed novelty and also in line with the new trends in the field of cosmetology.

Key words: liposomes, moisturizer, hyaluronic acid

357. ANALYSIS OF NANO DRUGS

Author: **Petru Sandulescu**

Scientific adviser: Anton Mihai, MD, University assistant, Department of Drugs Technology
Nicolae Testemitanu State University of Medicine and Pharmacy of the Republic of Moldova

Introduction. The properties of drug substances incorporated into nano-systems are often due not only to the properties of the substance but also to the nano-systems of which they are part. For this reason, the assessment of the quality of a nano drug requires a more complex check, which involves checking the structure of the nanoparticle. In particular, a rigorous control of their size is indispensable to ensure the improvement of the pharmacokinetic and pharmacodynamic behavior of the active substances. To meet these requirements, nano-drug analysis methods are supposed to be applied.

Aim of the study. Study of nano-drug analysis methods.

Materials and methods. The review of scientific literature on nanomedicine analysis methods has been performed.

Results. Information from literature demonstrates a number of advantages of using nano-drugs. The transport of the drug is directly to the biological target, bypassing the adverse effects and
