Proceedings nr. 4 from 03.05.2018

Lilian Globa, MD, MMed in Anatomy, lecturer of Department of Human Anatomy of *Nicolae Testemitanu* State University of Medicine and Pharmacy of the Republic of Moldova

Reviewers:

Ilia Catereniuc, PhD., university professor, the Department of Human Anatomy of *Nicolae Testemitanu* State University of Medicine and Pharmacy of the Republic of Moldova.

Tamara Hacina, PhD., university professor, the Department of Human Anatomy of *Nicolae Testemitanu* State University of Medicine and Pharmacy of the Republic of Moldova.

Descrierea CIP a Camerei Naționale a Cărții

Human anatomy : Neurology with Sense Organs & Angiology /
Nicolae Testemitanu State Univ. of Medicine and Pharmacy of the
Rep. of Moldova, Dep. of Human Anatomy ; collected and elab. by
Lilian Globa. – 2nd ed., revised and compl. for medical students. –
Chișinău : S. n., 2018 (Tipogr. "Print Caro"). – 360 p.

Bibliogr.: p. 359 (20 tit.). – 300 ex.

ISBN 978-9975-56-562-2.

For my parents: *Gheorghe and Aurica*

Motto:

"All (Human) beings' Actions, from Vegetative and Locomotive to Social interactions depend only on the Environments"

L.G.

Dear students and other readers,

In the surrounding world with all its beauty and pretty faces, the central and key place is occupied by **Humans**. These developed creatures reach the actual aspect after long and tortuous ways of environmental changes.

Cognition is a fantastic virtue which only man is equipped with. This special human quality is used and applied over all aspects of nature, all fields of existence including the man itself.

Because of man's division into two main components, the body and the soul, the cognition was focused over both of them.

The first science that steps into the investigation of the human body was **Anatomy**. To describe the human body structures initially, the simple knife (scalpel) was used. After all that, actual methods of medical imagery (CT, MRI, etc.) have been used for the investigation and depiction of the healthy (normal) or sick human body.

After a real or virtual sectioning of the human body we can discover an immense data of structures and shapes. It is necessary to name, classify this knowledge for it to be studied afterwards by students, physicians and other interested people. The huge amounts of anatomical terms transform Anatomy into an Encyclopedia, which is practically very difficult to memorize.

The goal of this book is to reorganize the concepts of studying the human body, taking in consideration general (simplified) schemes, special (particular) details for a practical (useful) medical approach.

I hope that this book style will be useful for a better understanding of the anatomical fields described here.

The Movement is the engine of all things. The chapters of this book are predestined to help you the understanding of the human movements.

We should take into account all events that follow inside and outside ourselves to be more clever and serviceable.

Any remarks and all proposals from You will be taken into consideration for the following editions.

Good luck!

L.G.
